## **Message of the Honorable Minister of Health Nutrition and Indigenous Medicine**

I am happy to send this message to the report of the National Health Accounts Sri Lanka for the years 2014, 2015, and 2016 prepared by the Ministry of Health, Nutrition and Indigenous Medicine. This is the continuation of the National Accounts production process initiated by the Ministry in 2013.

National health accounts answer the key questions faced by policy makers, how much do we spend on health? and how rational is the allocation of funds to different dimensions of the health system? In addition, National Health Accounts provides a complete picture of the healthcare financing of the country.

Hence, National Health Accounts become a very important document for health policy makers. The insight gained from the National Health Accounts 2014 to 2016 will be very useful in driving the health financing strategies of the Ministry of health in coming years.

I congratulate, all who were tirelessly involved in the analysis of health accounts and the production of this Report and urge them to continue the good efforts in coming years.

Hon. Dr. Rajitha Senarathne  
Minister of Health, Nutrition and Indigenous Medicine

## **Message of the Secretary of the Ministry of Health, Nutrition and Indigenous Medicine**

I am pleased to see the National Health Accounts 2014, 2015 and 2016, which was produced by the Ministry of Health, Nutrition and Indigenous Medicine Sri Lanka. This report provides an opportunity to review the funds utilization during these years for various healthcare functions, funds distribution among different health institutions. It also identifies the main financiers of the healthcare needs, and types of financial arrangements operate to handle the fund raising and purchasing health services around the country.

National Health Accounts provides a range of information much demanded by the health analysts and policymakers. Thereby, it provides valuable information to policy formulation on healthcare expenditure.

I encourage the National Health Account Team of the Ministry of Health, who have developed this excellent report based on an internationally accepted methodology. I am sure its usefulness goes beyond the boundaries of Sri Lanka.

Mrs. Wasantha Perera

Secretary

Ministry of Health, Nutrition and Indigenous Medicine

## Message of the Additional Secretary Medical Services

I am privileged to send this message to the National Health Account (NHA) Sri Lanka For the years 2014,2015 and 2016. National Health Accounts is a document which depicts the flow of funds through a Health system of a country. It describes fund flow not only for the Government but also for private sector. National Health Accounts reveals how much is spent for different aspects of health care such as curative, preventive and also for broad disease categories. It also shows the sub national health care expenditures. Moreover, the NHA is prepared as per WHO guidelines using Health Account Producing Tool (HAPT).

I express my sincere gratitude to Drs Neil Thalagala and Dileep De Silva of the NHA team from the Ministry of Health for their excellent piece of work. This production will be of immense help to health policy makers especially from Healthcare expenditure point of view.

In future, we are planning to bring NHA under the Human Resource Coordinating and Management Division of this Ministry and continue to publish this vital document in a more timely and regular manner.

Dr Sunil De Alwis  
Additional Secretary Medical Services

## Message of the Director General of Health Services

The dynamic nature of demographic compositions, epidemiology and technological advances in healthcare forces health systems to make continuous strategic adjustment in health financing strategies to ensure that the country faces the associated challenges effectively.

These strategic efforts require a comprehensive analysis of the current and past health financing dynamics of the health system. The System of Health Accounts 2012 (SHA 2012) proposed a framework for the systematic description of the financial flows related to Healthcare which provides most required information about health financing system of a country.

The Ministry of Health and Indigenous medicine of Sri Lanka is producing National Health Accounts of Sri Lanka using SHA 2012 methodology, since 2013.

This document, National Health Accounts Sri Lanka 2014, 2015, and 2016 will be immensely useful for Ministry for making evidence-based health financing decisions. In addition, it can be expected to provide many health financing insights to policy makers, health managers, preventive specialists, clinicians and students studying health finance.

I am extending my sincere gratitude to the entire team behind this report, who worked tirelessly under difficult circumstances to make it a success. The ministry is determined to further streamline the National Health Accounts production process and absorbed into the routine health system.

Dr. Anil Jasinghe  
Director General of Health Services  
Ministry of Health, Nutrition and Indigenous Medicine

## Acknowledgements

The combined report of the National health Accounts Sri Lanka, 2014, 2015 and 2016 is an outcome of efforts of many people. Services and cooperation rendered by all of them are highly appreciated and acknowledged.

National health Accounts team wishes to acknowledge the guidance provided by the Dr. Anil Jasinghe, Director General of Health Services and former Director General of Health Services Dr. Jayasundara Bandara during the production the report.

Dr. Udaya Ranasinghe, Senior Assistant Secretary (Medical Services), helped the team by facilitating administrative tasks involved in data gathering and providing administrative guidance throughout the project. His contributions are gratefully acknowledged.

National health Accounts team also thankful to the Chief Accountant Ministry of health and Indigenous Medicine, all the Provincial Directors and Provincial Health Accountants, Regional Directorates and Regional Health Accountants for providing expenditure data for the relevant years.

The team wishes to extend a special acknowledgement to Mr. I.S. Jayasundara Accountant- Revenue and Control Sri Jayewardenepura General Hospital for his support on gathering disease related expenses in the hospital.

National health Accounts team wishes to express sincere gratitude to WHO country Office for their support. The team also would like to acknowledge the guidance given by Mr. Chandrika Indikadahena of the Department of Health Financing and Governance, WHO, Geneva in the production of this report.

Several other organizations helped us in collecting the data. Relevant officials from the Insurance Board of Sri Lanka, Finance Commission, Insurance companies, NGO secretariat, and other Corporates and Banks are appreciated for providing the relevant data in preparation of NHA 2013. Heads of UN organizations, INGOS, NGOs and the Heads of Defense Medical Corps, Police and Prisons Hospitals and relevant officers are remembered with gratitude for their support by providing timely data for accounts

The officials from the Central Bank of Sri Lanka and Department of Census and Statistics have extended their fullest support in the preparation of National health Accounts. Their contributions are highly appreciated.

The National health Accounts team hope we will get the same unstinted support from all concerned in the future too, in preparation of National Health Accounts.

Dr Neil Thalagala  
Principal Investigator & Team Lead

## Executive Summary

This report presents the National Health Accounts of Sri Lanka for the years; 2014, 2015 and 2016. It reports the both recurrent (Current Health Expenditures) and capital expenditures (Capital Formation) of respective years. It also delineates the flow of money spent on health, from their sources of origin to the point of utilization, describes where the funds were utilized, for what purposes and on which illnesses.

National Health Accounts were formulated following the guidelines given by the System of Health Accounts 2011, published by the World Health Organization. The analysis of data and the report production were facilitated by the Health Account Production Tool which is also a standard software developed by the World Health Organization for this purpose.

The total current health expenditure in Sri Lanka for the years 2014, 2015 and 2016 were amounted to Sri Lankan rupees billion 374, 426, and 463 respectively. Capital investment made on the health sector for the same years were Sri Lankan rupees billion 30, 38 and 46 respectively. The current health expenditures for 3 years were approximately 4% of the GDP in respective years. Capital formation in relation to GDP was relatively low and was around 0.4 % of the GDP in the years in focus. Per capita current health expenditure in 2014 was Rs 18,119. That of 2015 and 2016 were 20,564 and 22,268 respectively.

The pattern of current health expenditures on various healthcare functions had similar compositions in all 3 years. Around 72% of total current health expenditure was spent on the curative healthcare. This included both inpatient and outpatient care covering the cost of complete medical care package given by hospitals from both government and private sector. Preventive care expenditures were found to be only 3% of the national current health expenditure throughout the period. Around 20% of current health expenditure was utilized for purchasing drugs, other supplies and private medical investigations including imaging services. Around 35% of the total current health expenditures was incurred on the Primary Healthcare Services.

Disaggregation of current health expenditures by diseases showed that non communicable diseases consumed around 36% of current health expenditure in all 3 years from 2014 to 2016. The second highest share (27%) of current health expenditure was utilized for providing care for infectious and parasitic diseases. Reproductive healthcare, mainly maternal and child healthcare and care for injuries utilized around 8% of current health expenditures of respective years.

Analysis of current health expenditures by providers showed that in all 3 years in focus, nearly a half (47%) of current health expenditure was spent for healthcare obtained at hospitals. The second highest expenses were attributed to the care received from the general practice providers (21%). Fourteen percent of current health expenditure was spent on drugs purchased at pharmacies and for other medical goods. Further 6% current health expenditure was spent in the private laboratories and imaging service provider institutions. Preventive care providers used 4% of current health expenditure.

Analysis of current health expenditure by districts indicated that the highest average per capita current health expenditure was from the Colombo district. This may partially reflect the presence of relatively higher number of specialist hospitals in the district. The second highest per capita current health expenditure was reported from the Jaffna district. National per capita current health expenditure was around 20,225.

Assessment of current health expenditure by sources of funds revealed that households and government sources have been the main source of revenues to the CHE in all 3 years. Around 50% of CHE in 2014 and 2015 were borne by the household out of pocket expenditures. It was raised to 53% of CHE in 2016. Government resources funded 44% of CHE in 2014 and 2015, while in 2016 the government contribution was 43% of CHE. Corporations and NPISH resources have contributed to 4% and 0.02 % of CHE in all 3 years. The contribution made by the foreign governments and development agencies (Rest of the world) was around 1% of CHE.

# 1 Introduction

The purpose of National health Accounts 2014, 2015 and 2016 is to make a systematic description of the financial flows related to the consumption of healthcare by Sri Lankan residents during these three years. The study of health financing system allows us to understand, who finance the healthcare, which arrangements are operating to pool funds, and use them to purchase or produce healthcare, what type of providers are involved and how much funds they utilize, what types of healthcare are consumed, how funds are distributed among different diseases and regional differences in healthcare resource utilization. This type of information is indispensable for decisions related to the good governance and health system administration. National Health Accounts help policy makers to capture financial flows related to healthcare provision, evaluate the financial gaps and appropriateness of spending in relation to access, epidemiology, dependency, and many other important dimensions [1].

System of Health Accounts 2011 (SHA 2011) provides the latest internationally accepted standard guidelines on producing national health accounts. It proposes a framework for the systematic description of the financial flows related to a health system based on an array of classifications. These classifications focus on various policy related questions, mentioned in the preceding paragraph [1].

This report presents the methods and findings of National Health Accounts for the years, 2014, 2015, and 2016 prepared by the Ministry of Health Sri Lanka. These National Accounts were produced following SHA 2011 guidelines and using the software: Health Accounts Production Tool (HAPT) version 4.0.0.6. [2].

## 2 The Health Financing System of Sri Lanka

Multiple stakeholders are involved in the financing of the healthcare needs of Sri Lankans. They include the Government, individual citizens (households), employers, insurance companies, international donors and local NGOs. Figure 1 shows the organizational framework of the health financing system of Sri Lanka.

The government has several financial arrangements (Financing Schemes) for managing, collecting, pooling of revenues and purchasing/producing healthcare services. The Central Government scheme covers the hospitals that are directly managed under the Central Ministry of Health (i.e. Teaching, General, Specialized Hospitals) and vertical preventive/disease control programmes, hospitals managed by Ministries of Defense (i.e. Army, Navy, Air force Hospitals, and Police hospital), and Justice (i.e. Prison hospitals).

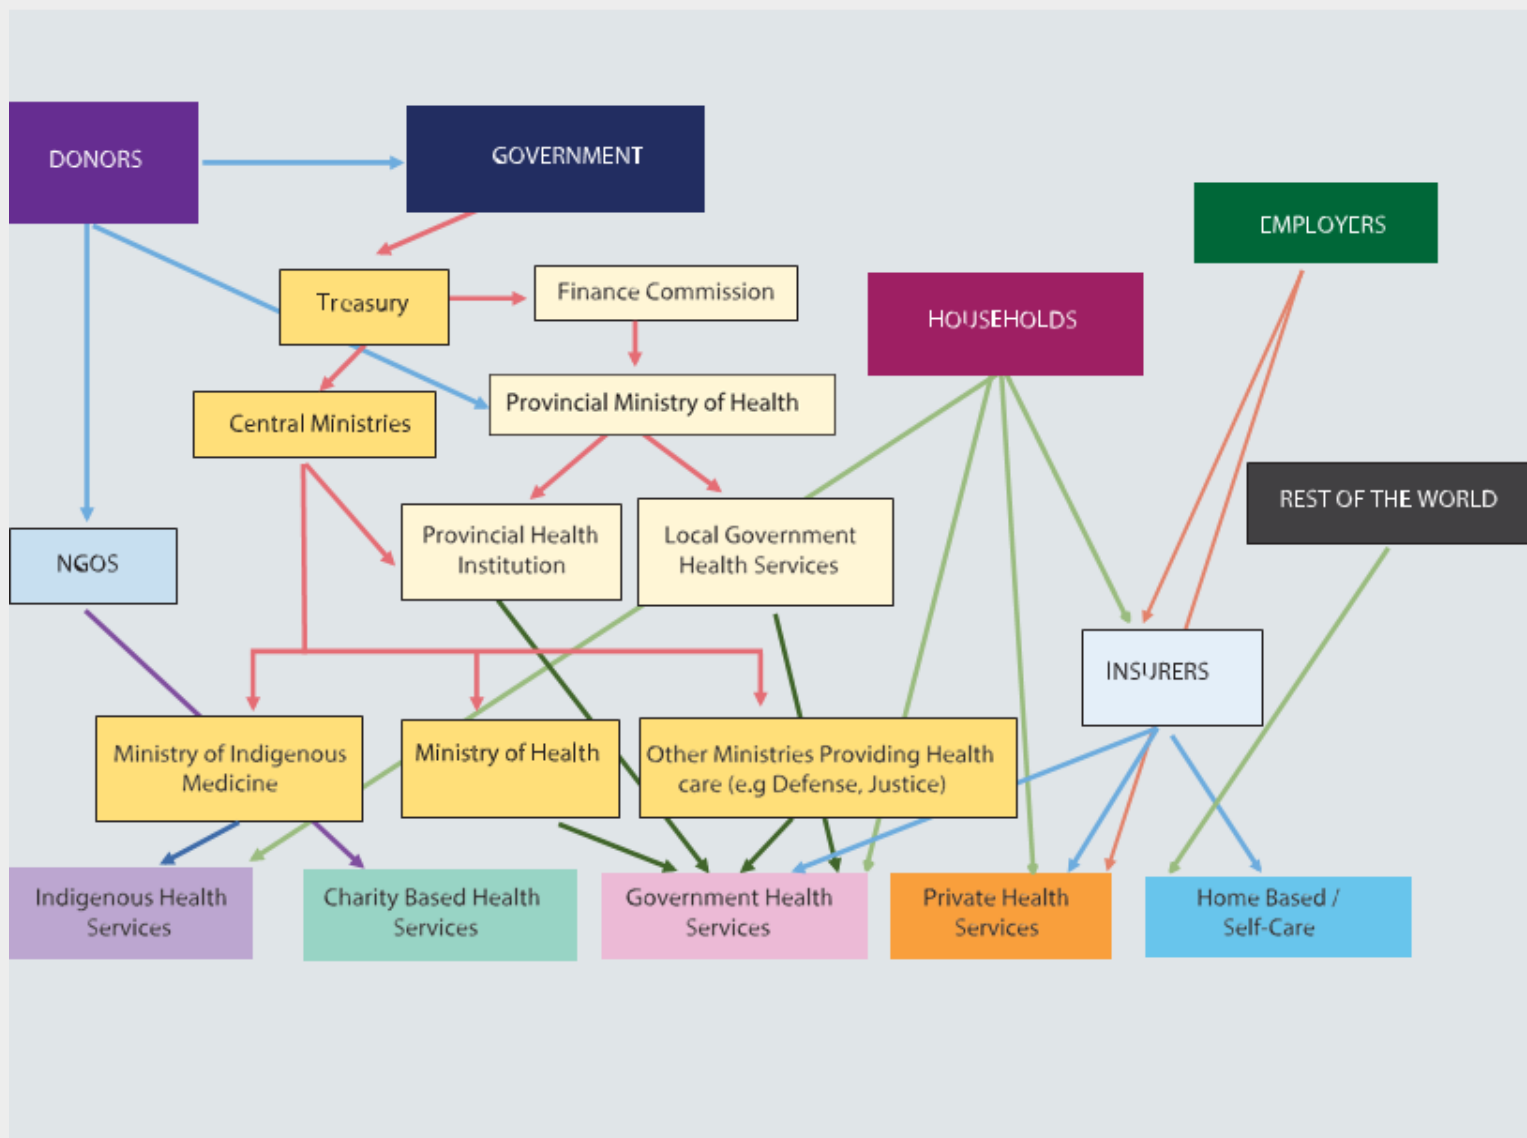

The Provincial government scheme manages finances related to healthcare services implemented by Provincial Governments (i.e. healthcare provided by Base Hospitals, Divisional Hospitals, Primary Care Units and Medical Officer of Health Units) and Local Governments (Municipal Council and Pradeshiya Sabha health clinics).

The funds meant for the central institutions are directly channeled through the budgets of respective ministries. Government funds for the Provincial and Local Government institutions are usually channeled through the Finance Commission. In addition, the Central Ministry of Health directly channels a considerable amount of funds to provincial level institutions. Moreover, the Provincial and Local Governments use funds generated by themselves for the provision of health services through the institutions under their administrative guidance.

A considerable number of patients seek care in government health facilities. Around 54 to 55 million outpatients and 5 to 6 million in-patients were treated in 1146 government hospitals the during 2014 to 2016 period.

Figure 1 Health Financing System of Sri Lanka

Government also invests on several preventive healthcare programmes. Interventions carried out by these programmes include, a) provision of early child care and development interventions to nearly 2 million children, b) provision of family planning to around 1.7 million women in reproductive ages c) control of Malaria, Dengue, STD /AIDS, other communicable diseases, d) control of non-communicable disease and other emerging diseases.

Citizens also contribute to a major share of health expenditure as Out-of-Pocket Spending (OOPS). Several distinct categories of OOPS can be identified. They include, payments for private outpatient care (general and specialized care), payments for private in-patient care, payments for pharmacy drugs (self-prescribed or physician prescribed), payments for other health related materials (e.g. spectacles, prostheses), payments for laboratory investigations, payments for dental care, and payments for indigenous treatment. Another kind of health-related payments by households include purchases of health insurance premiums. These expenditures are usually meant for obtaining healthcare from private providers, purchasing over the counter and prescribed medicines and other medical goods from pharmacies and paying for private investigation services.

Private corporations also contribute to the financing of healthcare service utilized by their employees and family members. Corporations either purchase health insurance schemes, reimburse health expenditures or run their own health facilities.

Two main health insurance schemes exist in Sri Lanka. The social insurance scheme devoted to government employees is called "Agrahara fund". Several private companies operate voluntary contributory health insurance schemes.

The contribution of Non-Profit Institutions Serving Households (NPISH) to healthcare financing in Sri Lanka is relatively small. The main revenues of NPISH financing schemes are from local or international donors.

Usually donors contribute as providers of revenue. The principle form of donor fund channeling in Sri Lanka is through government schemes. Some donors provide funds to local NGOs.

### **3 Overall Health Expenditures in Sri Lanka**

Sri Lanka National Health Accounts 2014 to 2016 distinguishes two main types of health expenditures: these include: 1) Current Health Expenditure (CHE) and 2) expenditure incurred for Capital Formation (CF) as recommended in SHA 2011 guidelines [3].

CHE includes all forms of expenditures made by households, the government, enterprises, nonprofit institutions serving households (NPISH) and rest of the world entities for purchasing or producing the health services and goods consumed by the residents within a year. It is important to note that CHE includes, in addition to the cost of direct final consumption expenses made by above parties, the cost of consumption of fixed capital incurred in the government health system. The consumption of fixed capital is defined as the decline, during the accounting period, in the current value of the stock of fixed assets owned by government healthcare providers.

Capital formation includes all investments made on infrastructure, equipment, etc. less disposals of capital assets.

CHE by definition is concerned with the expenses devoted for the accounting year, whereas the purpose of capital expenditure may extend beyond a calendar year.

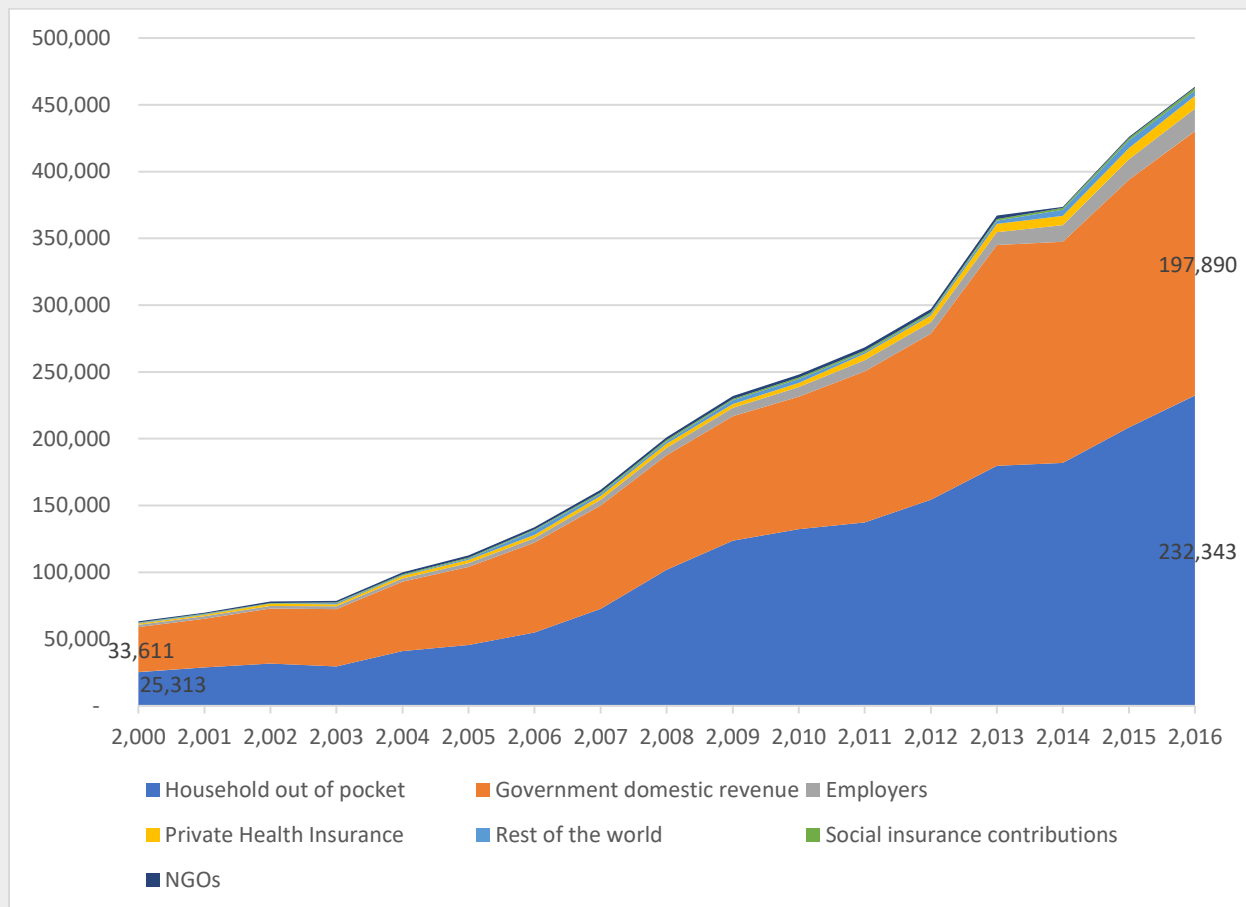

#### **3.1 Trends in Current and Capital Health Expenditures in Sri Lanka**

The government domestic revenues, and household out of pocket spending have been the principal sources of CHE in Sri Lanka over past 16 years. Relatively little contributions were provided by employers, private and social health insurances (Agrahara), NGOs and rest of the world revenue channels. Figure 2 presents the trends in the CHE in Sri Lanka from the year 2000 to 2016.

In 2000, around 53% of CHE was borne by the government sources, while 40% of CHE was borne by household out of pocket expenditures. Since then, the government and household out of pocket expenditures have been increased at annual growth rates of 13%

and 16% respectively. In 2016, nearly 50 % of CHE was borne by the household out of pocket expenditures, while 43% of it was borne by the government sources.

**Figure 2 Trends in relative contributors of CHE in Sri Lanka by different financing sources from 2000 to 2016 (Rs Mn in current prices )**

(Source: Global Health Account Data Base (WHO, National Health Accounts Sri Lanka Ministry of Health)

Table 1 presents the CHE and CFs in absolute amounts and as percentages of GDP, since 2000 to 2016. CHE as a percentage of GDP has remained around 4% throughout the period, while CF has remained around 0.3 to 0.4% of GDP. The government CHE (GCHE) in 2000 was around 2.3% of GDP and it has shown a gradual reduction to be 1.7% of GDP in 2016.

*Table 1 CHE, its components, CF and percentages of CHE, CF and GCHE as a percentage of GDP: 2000 to 2016 ((Rs Mn in current prices )*

Year	Total CHE	CHE- Household out of pocket	CHE- Government domestic revenue	CHE- Employers	CHE- Private Health Insurance	CHE Rest of the world	CHE Social insurance	CHE NGOs	Total CF	CHE as & of GDP	CF as a% of GDP	GCHE as % of GDP

## 4 Total CHE from 2014 to 2016

Total CHE in 2014 was Rs. million 373,673. This was increased to Rs. million 425,971 in 2015 and Rs. million 463,559 in 2016. As indicated in the table 1, CHE in 2014 amounted to 3.6% of GDP, while in subsequent 2 years, the percentages were around 3.9% of GDP (Figure 3).

## 5 Capital Formation from 2014 to 2016

Capital formation incurred in the health sector in 2014 was around Rs. million 30,337. The CF in 2015 was Rs. million 37,897, while it has risen to 45,872 in 2016 (Figure 3).

*Figure 3 CHE and CF: 2014-2016 (Rs Mn in current prices)*

## 6 Per Capita Health Expenditures from 2014 to 2016

Table 2 shows per capita total CHE in the 3-year period.

*Table 2 Per capita CHE in Sri Lanka 2014 -2016 (Rs/\$ in current prices)*

Expenditure type	2014		2015		2016	
	Rs	US\$	Rs	US\$	Rs	US\$
Per capita CHE	18,119	139	20,564	151	22,288	153
Per capita CF	1,471	11	1,830	13	2,206	15
Per capita GCHE	8,032	61	8,961	66	9,515	65

## **7 Consumer Perspectives of CHE: 2014 -2016**

Analysis of national health expense by consumer perspectives provides answers to the following questions. 1) What types of healthcare have been utilized by residents and at what costs (Healthcare Functions classification)? 2) What are the proportional allocations of national health expenditures for different illnesses (Disease Classifications) ?, 3) Does the health expenditure pattern vary by geographical area (Sub National Classification) ?

### **7.1 CHE by Healthcare Function (HC) : 2014 -2016**

Function, by financial terms, in NHA contexts, means a type of need that a financial transaction aims to achieve. Figure 4 and Table 3 illustrate, how the CHE from 2014 to 2016 was attributed to various healthcare functions based on healthcare needs of Sri Lankan residents.

Curative care includes both in-patient and out- patient care provided by government and private hospitals and ambulatory care provided by self-employed professionals including general medical practitioners, medical specialists, or other paramedical service providers. Rehabilitative care expenditure in this NHA report represents only the amount of expenditure made by government rehabilitation hospitals. “Ancillary services not specified by function” includes laboratory testing, medical imaging and other supportive services paid by private sector providers outside government services. “Medical goods non-specified by function” denotes therapeutic appliances, spectacles and hearing aids obtained from private sector providers. Preventive care includes all the services offered by medical officer of health teams around the country and the supplementary functions of the vertical programmes. (e.g. Family health programme, STD AIDS programme, Malaria control programme etc...)

**Figure 4 Percentage distribution of CHE by Healthcare Functions: 2014 to 2016**

In all 3 years of focus, around 72% of CHE was spent for obtaining curative healthcare services. One of the main policy concerns found in the analysis is the relatively lower share of CHE (3%) devoted for preventive care services. Table 3 presents the more detailed distributions of CHE by healthcare functions.

**Table 3 Distribution of CHE by Healthcare Functions: 2014 to 2016 (Rs. Mn in current prices)**

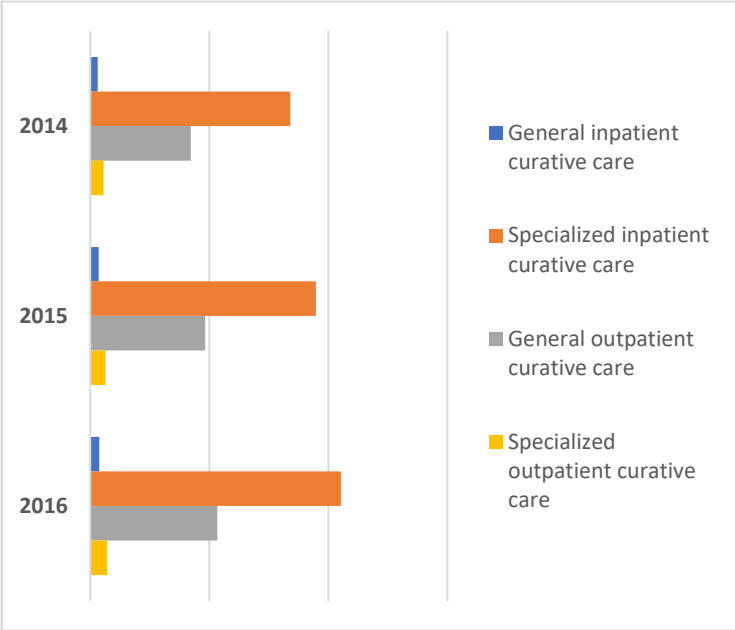

Healthcare functions		2014		2015		2016	
		#	%	#	%	#	%

The largest share of the CHE by healthcare function has been attributed to the curative care in all 3 years. Around 62% of all curative care expenses, was spent on specialized inpatient curative care services, in each year. These expenditures comprise the expenditures incurred for providing specialized inpatient care in both government and private sector, secondary and tertiary care hospitals around the country.

*Figure 5 Percentage share of curative care CHE expenses by level of care*

The next larger share of curative care was attributed to the general outpatient curative care (31%). These comprises all expenses incurred for the services delivered at the outpatient departments of government hospitals and general practices. Relatively smaller share of curative care CHE was attributed to general inpatient curative care and specialized outpatient curative care. General inpatient care, which comprises, 2% of curative care CHE, includes the government health expenditure incurred in the inpatient wards of the Primary Healthcare Hospitals. Four percent of curative CHE covers the out of pocket expenditures made on specialized outpatient care obtained at private hospitals.

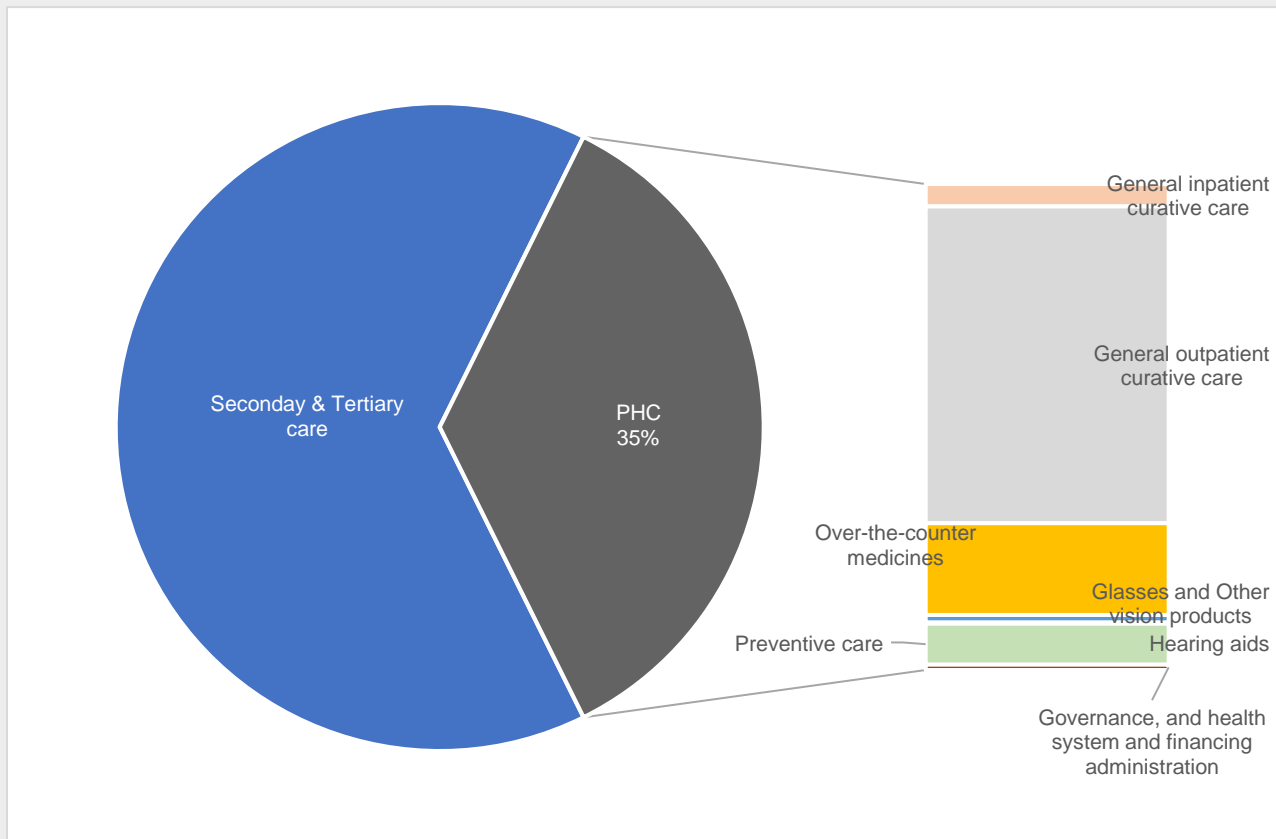

Ancillary services non specified by function, which consumed 6% of CHE, include the out of pocket expenditures made on laboratory investigations and medical imaging. These expenditures comprise expenses of health services that are directly sought at private hospitals or general practices as well as the out of pocket expenses made by patients for ancillary services based on the request of government hospitals.

Fourteen percent of CHE was spent on the medical goods non specified by function. They include the expenditures made on the over the counter medicines purchased by patients, expenditures for purchasing government hospital prescriptions at pharmacies, and the expenses made on purchasing therapeutic appliances such as spectacles and hearing aids in at private providers.

## 7.2 CHE for Primary Healthcare

This section estimates the cost of CHE devoted to the Primary Healthcare (PHC) services. In Sri Lankan perspective PHC expenditures includes, expenditures related to general out- patient care given by non-specialist medical officers at divisional and specialist hospitals, inpatient care given at divisional hospitals, all the services given by Medical Officer of Teams around the country and the ambulatory services offered by general practitioners. In addition, the expenditures made on over the counter self-medications, expenditures involved in purchasing medical appliances are factored in to the PHC costs. The following figure presents the composition of the PHC expenditure in Sri Lanka in the year 2016.

*Figure 6 Percentage of PHC expenditure in 2016*

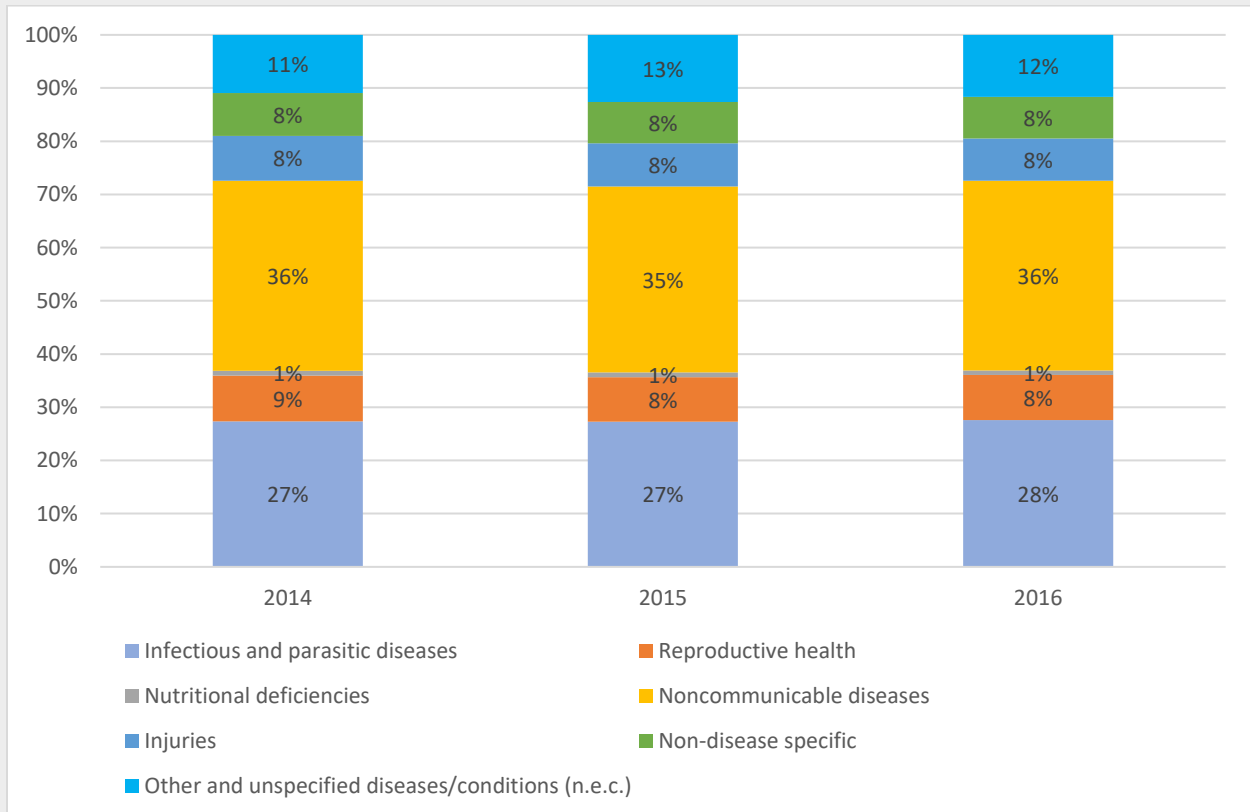

NHA 2016 showed that 35% of total CHE in the year 2016 was devoted for PHC interventions. Of PHC expenditure, the largest share was spent for paying general outpatient care (65%) and purchasing over the counter medicines (19%).

### 7.3 CHE by Diseases (DIS) : 2014 -2016

Figure 7 presents the percentage distribution of CHE by broader disease groups.

*Figure 7 Percentage distribution of CHE by Diseases: 2014 to 2016*

Over one third of CHE in all 3 years in focus was spent on non-communicable diseases (NCDs). The second highest expenditures (27%) were for managing and controlling infectious diseases. Reproductive health related health conditions and injuries consumed 8% of CHE respectively. CHE on nutritional issues amounted to 1% of CHE. Table 4 presents the CHE by subcategories of illnesses.

Out of NCD expenses, the largest share (33%) was attributed to non-infective respiratory diseases such as asthma and chronic Obstructive airways diseases. Cardiovascular diseases, mainly ischemic heart diseases and hypertension and non-infective gastrointestinal diseases each separately accounted for 10%, of NCD related CHE

respectively. Mental and neurological diseases, sense organ diseases each separately accounted for 7% of NCD related CHE respectively. NCD related CHE attributed to Diabetes as well as to neoplasms were around 4% each. Diseases of the genito urinary system which included kidney disease accounted for 5% of total NCD related CHE.

	All diseases	373,673	100%	425,970	100%	463,559	100%

On average, more than half CHE related to infectious diseases in a calendar year (53%), was attributed to respiratory infections excluding tuberculosis. Tuberculosis related CHE was around 1% of infectious diseases related CHE. HIV/ AIDS and vaccine preventable diseases each consumed 1% of infectious disease related CHE respectively. Financial cost of Dengue control and treatment was around half a percent of total infectious disease related CHE.

Reproductive conditions which included pregnancy care, child care and contraceptive management consumed around 8% of CHE.

## 7.4 CHE by Geographical Regions (SNL) : 2014 -2016

Table 5 presents the distribution of CHE by sub national regions. Around one third of CHE was spent in the Western Province.

Figure 8 shows the distribution of CHE and per capita CHE by districts. The highest average per capita CHE for 2014 to 2016 period was reported from the Colombo district. This may partial reflects the presence of relatively higher number of specialist hospitals in the district. The second highest per capita CHE was reported from the Jaffna district. National per capita CHE was around 20,225 per the period and only 4 out of 25 districts (Colombo, Gampaha, Jaffna, Kandy districts) had a per capita expenditure less than the national average.

**Figure 8 CHE from 2014-2016 Rs. Mn in current prices) and average per capita CHE (for 2014 to 2016) by districts (Rs)**

## 8 Provider perspectives of CHE

SHA 2011 categorizes healthcare providers as hospitals, general practices (ambulatory healthcare), providers of ancillary services (medical laboratories and imaging services), pharmacies (retailers and other medical goods providers), preventive care providers and providers of health system administration.

### 8.1 CHE by Providers of Healthcare (HP) : 2014 -2016

In all 3 years in focus, nearly a half (47%) of CHE was spent for healthcare obtained at hospitals. The second highest expenses were attributed to the care received from the general practice providers (21%). Fourteen percent of CHE was spent at pharmacies and other providers of medical goods using out of pocket expenses. Further 6% CHE was spent in the private laboratories and imaging service provider institutions.

*Figure 9 Percentage distribution of CHE by Healthcare Providers: 2014 to 2016*

Preventive care providers used 4% of CHE. Providers of healthcare administration system utilized only 1% of the CHE. Table 6 presents the detailed disaggregation of CHE from 2014 to 2016.

**Table 6 Distribution of CHE by Healthcare Providers: 2014 to 2016 (Rs. Mn in current prices)**

Code	Healthcare providers	2014		2015		2016

In each year, 82% of total CHE used in hospitals was utilized for healthcare provision in various forms of government hospitals. The CHE utilized in private hospitals was only 8%. Figure 10 presents the percentage distribution of CHE used by government hospitals in 2016 by levels of care.

**Figure 10 Percentage distribution of CHE utilization in government hospitals :2016**

The largest share of CHE attributed to government hospitals (48%) were used by the tertiary care hospitals. Further 44% was used by the secondary care hospitals. PHC hospitals used the remaining 8% of the CHE attributed to government hospitals.

## 8.2 CHE by Factors of Healthcare Provision (FP) : 2014 -2016

The classification of Factors of Healthcare Provision attempts to disaggregate the CHE in to 1) expenditures attributed to human resource payments in hospitals and other health institutions ( compensation of employees), 2) self-employed professional remuneration ( fees received by general practitioners, which may involve the cost of drugs, and infrastructure items in additions to payments to human resources and profit. 3) cost of materials and services used in the healthcare production, and 4) cost of consumption of fixed capital (loss of value due to obsolescions and usual wear and tear of capital assets used in healthcare provision.

Figure 11 Percentage distribution of CHE by Factors of Healthcare Provision: 2014 to 2016

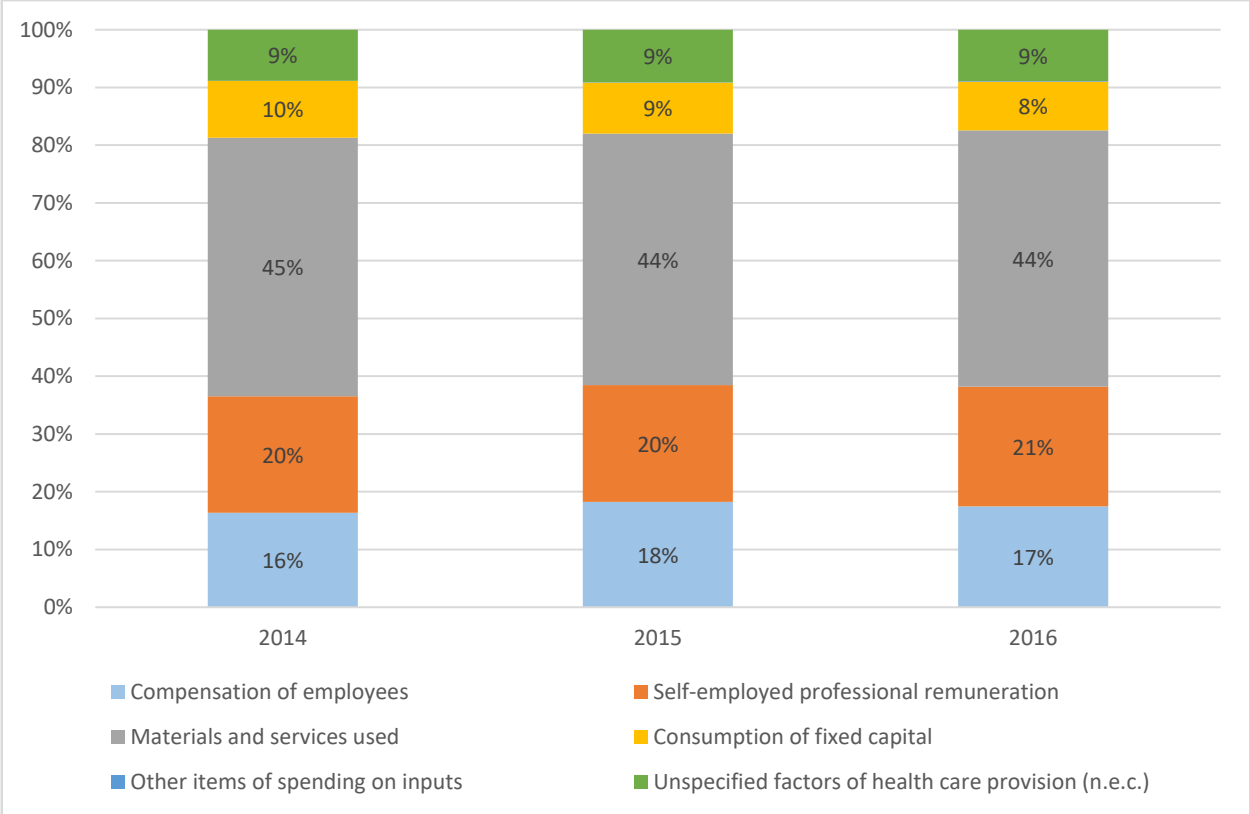

Figure 11 shows, that the largest share of CHE (44%) was attributed to the cost of materials which is manly comprised of drugs and other medical supplies during the years concerned. The second largest share of CHE was spent in the private general practice (21%), marked as self-employed professional remuneration. Salaries and other emolument of employees in health services used further 17% of CHE. Consumption of

fixed capital amounted to 8 to 10% of CHE in each year of concern. Table 7 presents the detailed disaggregation of CHE by the Factors of Healthcare Provision.

## 9 Financial perspectives of CHE

Analysis of CHE by health financing dimensions describes, how the funds related to health care flow from various fund providers (*Institutional units providing revenues to financing schemes - FSRI*), using various revenue mechanisms (*Revenues of Financing Schemes -FS*), financing arrangements (*Health Financing Schemes -HF*), and financing agents (Financing Agents -FA), until they are finally utilized to purchase or produce the healthcare services offered by all types of providers.

For example, Figure 12 shows the financial flows related to CHE in Sri Lankan context. Government and household are the principal providers (over 95%) of health financing resources. The contributions made by corporations, NGOs and Rest of the World Donors are found to be relatively small.

Government funds reach health services as internal transfers to various government institutions and as the employers' contribution of the social insurance (Agrahara). The revenue mechanism for pooling the remaining portion of social insurance scheme (Agrahara) is coming from households. Households funds are channeled through revenue mechanisms. They include the funds used for purchasing primary insurance schemes (*Voluntary prepayment from individuals/households*) and the direct payments for private healthcare as Other revenues from households n.e.c. (OOPS). Corporations funds also channeled through two revenue mechanisms. i.e. *Voluntary insurance prepayment from employers* and *Other revenues from corporations n.e.c.* that covers the reimbursement of healthcare bills of employees and maintaining workplace-based healthcare delivery points.

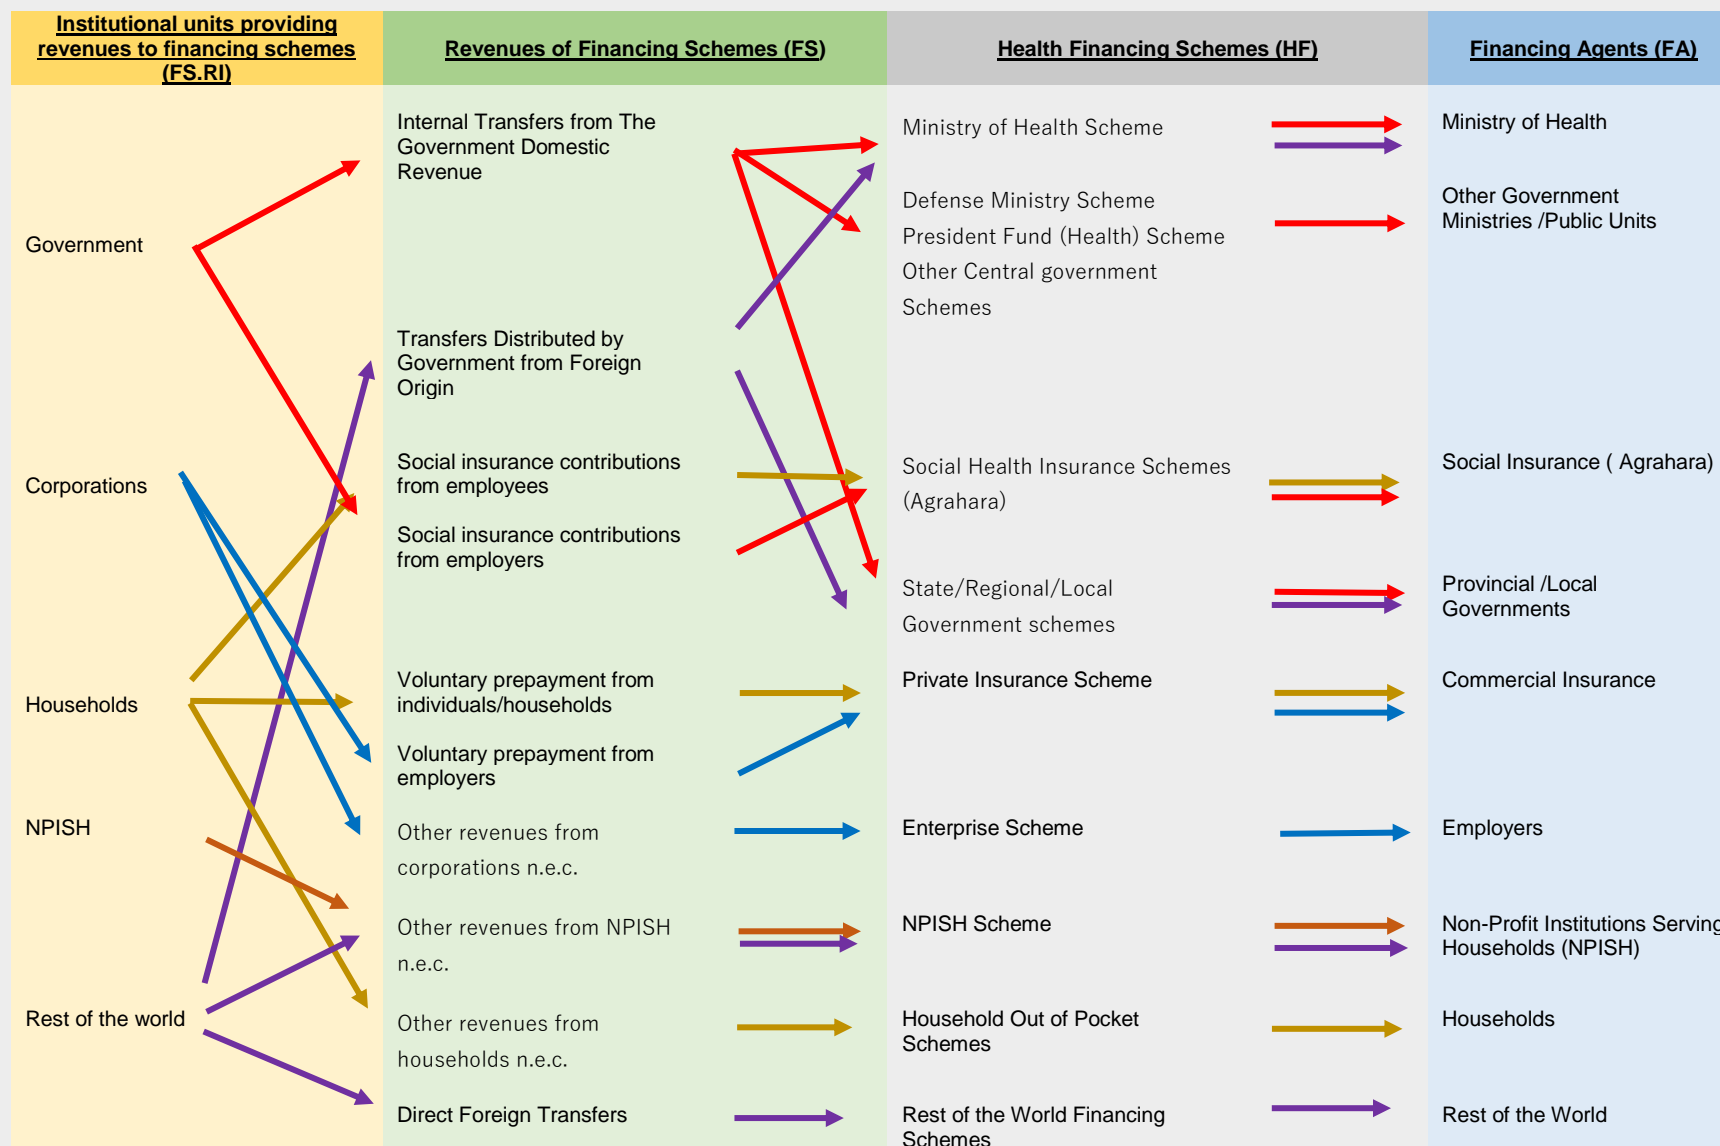

The rest of the world financing sources rely on the government to distribute the major share of their contribution to the country through the revenue mechanism called Transfers Distributed by Government from Foreign Origin. The remaining portion of the Rest of the World funds are added as Direct Foreign Transfers.

The government uses several financing schemes (*Ministry of Health Scheme, Defense Ministry Scheme, President Fund (Health) Scheme, Other Central government Schemes,*

*and the social health insurance scheme (Agrahara)* to handle its funds. Revenue mechanisms of these financing schemes follow somewhat complex arrangement as indicated by the crossing arrows of the figure 12. The financing schemes related to private health expenditures have more or less direct correspondence with the respective revenue mechanisms.

A clear one to one correspondence is observed between the health financing schemes and financing agents as indicated by figure 12.

Figure 12 Financial flows related to CHE in Sri Lanka

### 9.1 CHE by Institutional Units Providing Revenues (FS:RI) : 2014 -2016

Figure 13 presents the distribution of CHE from 2014 to 2016 according to the institutions providing the revenues. Households and government sources have been the main source of revenues to the CHE in all 3 years. Around 50% of CHE in 2014 and 2015 was borne by the household out of pocket expenditures. It was raised to 53% of CHE in 2016. Government resources were used for the 44% of CHE in 2014 and 2015 while in 2016 the government contribution was 43%. Corporations and NPISH resources have contributed to 4% and 0.02 % of CHE in all 3 years. Rest of the world contribution was around 1% of CHE.

*Figure 13 CHE from 2014 to 2016 according to the Institutional units providing revenues to financing schemes (FS:RI) (LKR. Million)*

Table presents the detailed disaggregation of CHE by various sources of funding.

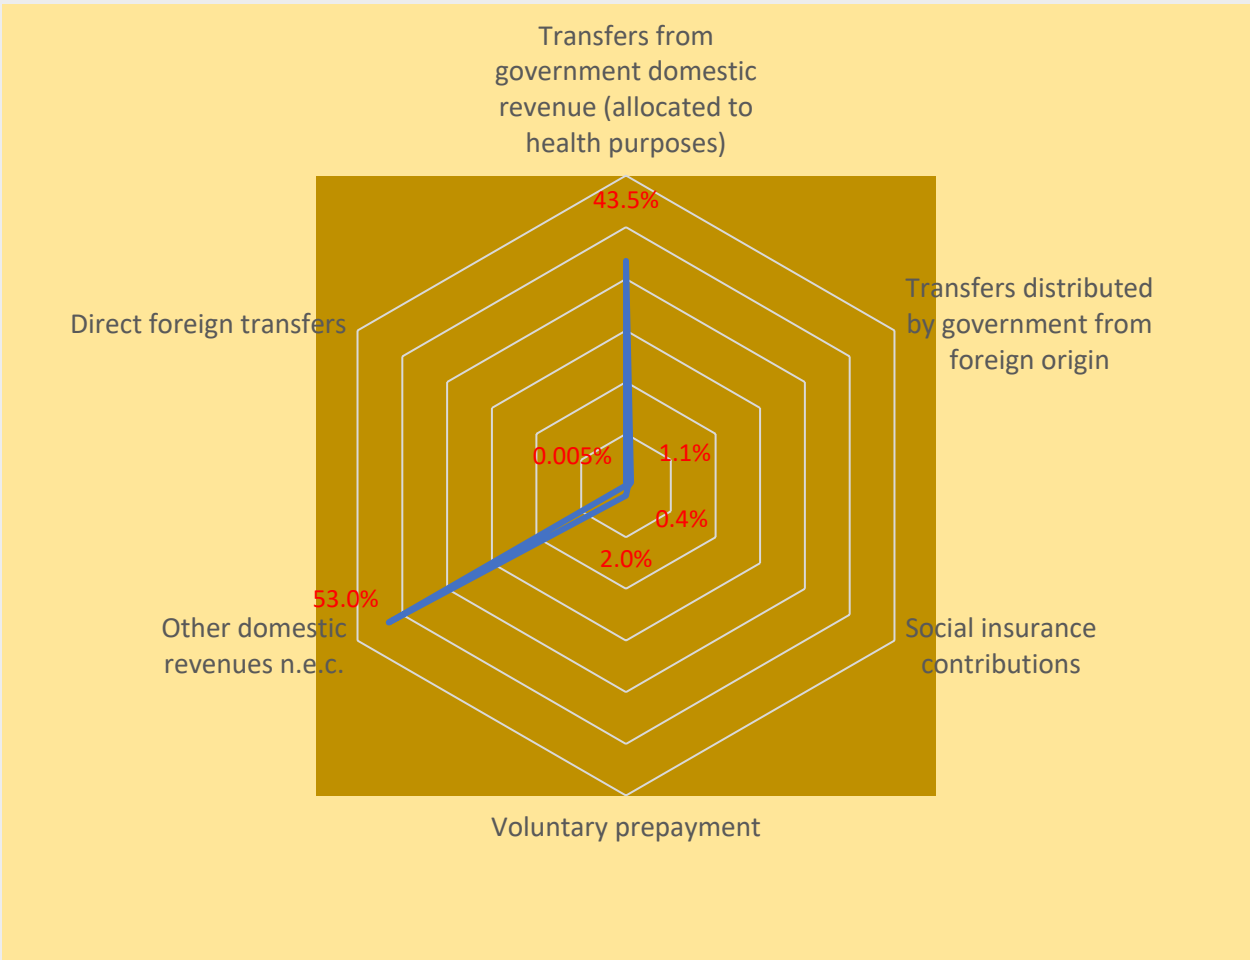

**Table 8 Distribution of CHE by Institutional Units Providing Revenues to Financing Schemes: 2014 to 2016 (Rs. Mn in current prices)**

## 9.2 CHE by Revenues of Healthcare Financing Schemes (FS) : 2014 - 2016

This section presents the amounts of CHE channeled through various revenue mechanisms. Revenue mechanism are the mode of transferring the funds of different sources. More than half of CHE (53%), was received as *Other Domestic Revenues n.e.c.* which includes revenues from households, corporations and NPISHs. Transfers from government domestic revenue accounted for 43.5 % of CHE revenues. Voluntary prepayments accounted for 2 % of CHE while social insurances did so for only 0.4% of CHE. Direct foreign transfers and transfers distributed by government of foreign origin accounted for around 1% of CHE (Figure 14).

**Figure 14 Average annual percentages of CHE channeled through various Revenues of Financing Schemes during the 2014 to 2016 period**

### 9.3 CHE by Financing Schemes (HF) : 2014 -2016

Financing schemes are the main arrangements used by various health financing agents to handle the funds made available through the different revenue mechanisms. Figure 15 presents the average annual percentage distribution of CHE during the period from 2014 to 2016.

*Figure 15 Average annual percentages of CHE channeled through various Financing Schemes during the 2014 to 2016 period*

Above radial graph shows that around 45% of CHE in Sri Lanka is applied under government schemes that includes Ministry of Health Scheme, Defense Ministry Scheme, President Fund (Health) scheme, Other Central government schemes and State/regional/local government schemes. A half of CHE is financed from household out of pocket payments and management of these funds happens in informal manner under the discretion of people who spend them. Only 2.4% of CHE is managed as insurance

schemes that include the Agrahara government social insurance scheme, employer-based insurance and other primary insurance coverage schemes. Enterprise financing schemes accounted for 3.5% of CHE. Rest of the financing schemes accounted for very small percentage of CHE, However, this scheme covers only the direct financial investment made by the Rest of the World agencies and major share of Rest of the world investments are managed under government schemes as they are usually become revenues for the government funds as Transfers Distributed by Government from Foreign Origin.

Table 10 presents the distribution of CHE by the financial arrangement handled them.

## 9.4 CHE by Financing Agents (FA) : 2014 -2016

Financing agents are the actual institutional arrangements who collect pool and direct funds for the healthcare service production and purchasing. Figure 16 shows the annual average percentage of shares of CHE handled by different financing agents during 2014 to 2016 period.

*Figure 16 Average annual percentages of CHE handled by various Financing Schemes during the 2014 to 2016 period*

In Sri Lanka the largest amount (49.3%) of CHE was handled by households. Government financing agents includes Central Government, Provincial and Local Governments and the National Insurance Agency, Agrahara, they collectively handled 45% of CHE. Other

financing agents contribution was relatively less. Table 12 presents the distribution of CHE by financing agents.

*Table 11 Distribution of CHE by Financing Agents: 2014 to 2016 (Rs. Mn in current prices)*

## 11 Methodology

This NHA report covers the current and capital expenditures incurred in Sri Lanka in 2014, 2015 and 2016 years. A separate NHA was prepared for each year. The data collection was carried out by the members of the NHA team with the help of 2 data collection assistants.

Data was processed and pre-coded using Microsoft Excel sheets. The Health Account Production Tool (HAPT) SHA 20111 (v 4.0.0.6) was used for production of accounts.

### 11.1 Customization of NHAs

A separate account was prepared for each calendar year. The scope of the NHAs were limited to the following SHA 2011 classifications.

1. FS:RI- Institutional units providing revenues to financial schemes
2. FS- Revenues of health care financing schemes
3. HF- Healthcare financing schemes
4. FA- Financing Agents
5. HC- Healthcare functions
6. HP- Healthcare providers
7. FP- Factors of provision
8. SNL- Sub national
9. DIS- Classification of diseases /conditions
10. HK- Capital accounts
11. HC.RI.- Traditional. Complementary and Alternative Medicine (TCAM).

Current values of expenditures were used in each year.

## 11.2 Data Sources and Data Collection

Data sources were identified based on the experiences gained during the production of NHA 2013. The request letters were sent to stakeholders to obtain the health expenditure data for the 3 years concerned. All the data were gathered as secondary data.

Government data was gathered from the Accounts Division of the Ministry of Health. The provincial health expenditures were obtained from 2 sources: Finance Commission and from respective accounts divisions of Provincial Directorates. The data from donors were obtained as secondary data. Donor and NGO data were gathered by sending direct requests to respective Donors and health related NGOs registered in the NGO secretariat. NGO secretariat supported this activity. Expenditures related to NGOs that did not respond to the data request was imputed based on existing data on expenditures. Employers expenditures were also obtained as secondary data. Nonresponding employers had to be omitted.

Household out of pocket expenditures were obtained from health component of the private consumption expenditure (PCE) estimates made by the Sri Lanka National Accounts. The Department of Census and Statistics, who prepare National Accounts recently adjusted the base year of its estimates to 2010. This resulted in a considerable increase in household expenditure when compared to household expenditures reported in the NHA 2013.

## 11.3 Data processing, importing and mapping

Data obtained from different sources were organized in excel files, by making excel columns reflecting expenditure values and various descriptive and classification codes.

The mapping process was expedited by pre entering respective classification codes to the data columns that were matched for HAPT base column headings and executing auto binding feature of the HAPT. Emphasis was made on reviewing any warning flags surfaced during 'auto binding' and import process.

Post data import mapping was carried out only for the expenditure items that were distributed across more than one classification category. For these items respective mapping assumptions/rules were identified on pro rata basis that reflected attribution of funds to related expenditure categories. Repeat mapping feature was used to expedite mapping of expenditure items with similar financial flows.

### **11.3.1 Mapping government data**

Financial data of the Central Government institutions were available by each institution disaggregated as traditional budget categories (personnel emoluments, travelling, supplies etc.). This allowed most items to be easily assigned to a single classification category. However, mapping rules were required for Health Care functions (HC), Disease (DIS) categories and Sub National (SNL) classifications of some ( e.g. drugs) of the expenditure items.

Basis for creating mapping rules of HC, DIS and SNL classifications were as follows.

A secondary data base on disease burden as reflected by inpatient days and inpatient equivalents of outpatient visits were created using the data of the routine hospital information system (HIS). In Sri Lanka, each curative health institution routinely reports the number of admissions by ICD disease categories and number of OPD visits. Average number of inpatient days by diseases (coded by ICD categories) were also available from a recently initiated electronic information system which cover around 80 % of total health institutions in Sri Lanka.

This secondary data base comprising of total number of inpatient days by ICD disease categories spent at all curative care institutions in the year 2013 was created by applying average number of inpatient days (IPDs) to numbers of inpatient admissions taken from above mentioned hospital systems. This data base provided the basis for identifying proportional allocation of inpatient days by broader disease groups (based on Global Burden of Diseases Classification) by health institutions situated in different districts.

Total number of OPD visits in each institution was also added to same data file as an additional variable column. The number of these OPD visits were converted to IPD

equivalents based on average OPD patient care cost to Inpatient care cost ratios calculated by Sri Lankan hospital cost center studies.

As routine information system does not record OPD visits by disease. This information was obtained from a special sample survey data conducted in 2013 to find out the OPD disease distributions. The study was carried out in a stratified cluster sample of OPD patients, who were distributed among 8 out of 25 districts and represented patients attending all major types of hospitals (teaching, general, base, Divisional and PMCU). OPD disease distributions by ICD classifications were obtained after analyzing this survey data, which reported diagnoses of OPD patients seen by medical officers.

The ratios of total in-patient days to in-patient equivalents of OPD visits in different types of curative care institutions were used to create mapping rules related to HC classification. Separate HC mapping rules were created for Teaching, Provincial and General Hospitals, Base Hospitals, Divisional Hospitals and Children's Hospitals

While preparing disease classifications for different types of curative care institutions, the proportional distribution of total in-patient days pertaining to the GBD groups were used as the basis. Separate mapping rules were created for Teaching, Provincial and General Hospitals, Base Hospitals, Divisional Hospitals, Children's Hospitals and hospitals of Defense Forces.

Mapping rules for Disease disaggregation of OPD health services were based on proportional distribution of OPD diagnoses by GBD classification. Considering clinical experience of many experts OPD disease distribution patterns were assumed to be similar in all types of institutions.

Another mapping rule was created to reflect the overall disease distribution of the entire country. To create this, the IPD equivalents related to OPD visits paid for different illnesses were added to respective national in-patient day totals. The sum of in-patient days and corresponding in-patient equivalents of OPD visits pertaining to each disease was used as the pro rata basis for disaggregating expenditure items such as expenses borne by the Ministry of Health by Disease classifications.

As institutions in the data base could be easily identified by geographical distribution, the same data bases could be easily used to estimate disease distributions by districts. It was assumed that sub-national variations in disease distributions are too small for considering separate disease mapping rules per district (Sub-national unit). Hence, whenever necessary mapping rules for SNL distributions of curative health services were based on the proportional allocation of total patient days (IPD plus IPD equivalents of OPD visits) in each district. Sub National Level (SNL) distributions of expenditure borne by National Level Governance /Administration Institutions such as the Ministry of Health was based on the probabilities proportional to the sizes of population in each district.

In Sri Lanka, all drugs used in government institutions are procured and distributed by the Medical Supplies Division of the Ministry of Health. A small proportion of drugs are locally purchased by hospitals. The total purchase cost of drugs, proportional distribution of drugs by major disease classes, types of institutions that received drugs were available.

One of the main constraints in describing expenditure patterns by diseases was the assumption that expenditure by diseases were proportional to the number of total in-patient days utilized by each type of illness. While it may be assumed that hotel costs (i.e. cost of accommodation, water, electricity and other utilizes) are proportional to the time spent in a hospital irrespective of the disease, the same assumption may not be applicable to drug costs. In order to reduce this bias, over all drug cost reported by the MSD was redistributed as cost of ear marked drugs that can be directly assigned to specific diseases or a disease group (e.g. surgical drugs that can be assigned by a special mapping rule based on surgical conditions). Only remaining drug costs were assigned by using total patient days-based mapping rules.

Separate mapping rules were created for assigning expenditure items related to different preventive programs implemented by the Ministry of Health to disease classifications. These mapping rules were created based on the service provision indicators reflecting shared contribution to different disease conditions focused by these programs.

### **11.3.2 Mapping household data**

Household expenditure was estimated based on Private Final Consumption Expenditure estimates of the Sri Lanka National Accounts. The total amount of household expenditure

obtained in this manner was further disaggregated as: Health expenses, Fees for private medical practices, Fees for Ayurveda practitioners, Consultation fees for specialists, payments to medical laboratories, payments to private hospitals/ nursing homes, purchase of medical/ pharmacy products, spectacles, hearing aids, scans, X-rays and others; based on proportional distribution of these items as enumerated by Household Income and Expenditure Survey ( HIES) Sri Lanka 2016.

The same pro rata used for government inpatient and outpatient care expenses were also used to assign the expenses to disease classification in relevant categories of household expenditure. Mapping rules for SNL classifications were based on estimates of district level OOPs computed based on the district level per household expenses determined in HIES survey 2016.

### **11.3.3 Mapping employer data**

It was assumed that OPD and in-patient disease patterns among employed people were more or less similar to the corresponding patterns observed among government hospital settings. Hence, the same disease mapping rules used to map government data were used for employer data as well. It was not possible to obtain the sub- national level distribution among employer healthcare receivers. The relative proportions related to the distribution of total number of employed populations in districts were used as a proxy variable that reflect distribution of employer based healthcare expenses.

### **11.3.4 Mapping insurance data**

Data bases maintained by two large insurance companies provided disease classification data required for creation of mapping rules related to disease classifications of insurance data. The mapping rules for SNL distribution of insurance data were based on the relative proportions of insurance premium purchase amounts by districts. These proportions were

estimated based on the relative sizes of household expenditure related to purchase of insurance services by districts as estimated in HIES survey 2016.

## 11.4 Calculation of consumption of fixed capital

Consumption of fixed capital (CFC) for buildings, vehicles and equipment (Medical and other) and furniture belonged to the Ministry of Health were calculated for each year. The number and types of capital items prevailed during the past years were listed by reviewing past annual health bulletins and other relevant reports. Then for each year, annualized capital cost (CFC) for corresponding items were calculated. Annualized capital cost was based on the following formula [7]:

$$\text{CFC}_{it} = (\text{RC}_{it} / \text{Annualization factor}_{it})$$

Where

$\text{CFD}_{it}$  = Consumption of Fixed Capital of infrastructure item  $i$  in year  $t$ )

$\text{RC}_{it}$  = Replacement cost of infrastructure item  $i$  at the end of year  $t$  = (Present cost \* (1 + real  $r$ ))

Real  $r$  = real interest rate =  $[(1 + \text{nominal interest rate}) / (1 + \text{annula inflation})] - 1$

Annualization factor =  $(1/r) \times [1 - (1 / (1+r)^n)]$ :

where;  $r$  = real interest rate,  $n$  = life span of the infrastructure

Real interest rate was calculated using the nominal interest rates and inflation rates pertaining to each year. Life span of building were set at 60 years, while those for vehicles and equipment assumed to be 10 and 5 years respectively.

## 12 Conclusions

National Health Account 2014-2016 has described the healthcare financing from different perspectives as suggested by the WHO. It describes the source of funding, channeling of funding and the end users of funding in the complex and dynamic health system of the country. Disease specific expenditure is a dimension that only few countries had tried to

emulate. This dimension is also available in the Sri Lanka National Health Account. Though it is a combined publication for years 2014, 2015 and 2016, it clearly gives the break down figures for each year separately. It is noteworthy that this production is done using WHO's Health Account Production tool (HAPT).

It is of the view of the NHA team that this production will help not only the Ministry of Health, Nutrition and Indigenous Medicine but also the private sector healthcare providers in their strategic planning for better delivery of healthcare in Sri Lanka.

NHA team plans to further improve the data collection methods and address any methodological concerns in its future productions.
