

2006

Cancer Incidence Data Sri Lanka 2006

National cancer incidence data of 2006 in Sri Lanka is presented according to demographic variables, age, sex, ethnicity and geographical distribution and by site and histology of cancers.

Message from the Minister of Health

I am pleased to release this message on the launch of the 8th publication of the Cancer Registry Sri Lanka, “Cancer Incidence Data Sri Lanka 2006” by the National Cancer Control Programme.

Cancer surveillance information is important in the planning and implementation of prevention and control activities and in resource allocation for provision of services.

In the “Mahinda Chintana- Way Forward” policy of His Excellency the President and the Health Master Plan, of the Ministry of Health, cancer control has been identified as an important area for intervention as it is one of the four major Non Communicable Diseases which is on the increase.

I wish to thank the Director and the staff of the National Cancer Control Programme for their hard work and also the WHO for its continued support in this activity.

Hon Mathripala Sirisena

Message from Secretary, Ministry of Health

It is a pleasure to send this message for the publication, “Cancer Incidence Data Sri Lanka-2006” which is the 8th publication in the series. Data on cancer incidence is essential for the proper planning and implementation of cancer control activities in Sri Lanka.

It will be invaluable for professionals who conduct cancer research and the series of publications would be useful for analysing epidemiological factors and trends which would be useful in generating hypothesis for future research.

The information that could be generated from this publication will also be valuable for future expansion of curative care services in the country.

Finally, I sincerely appreciate the efforts of the staff of the National Cancer Control Programme who worked tirelessly for this publication and the World Health Organisation for supporting the cancer surveillance activities in Sri Lanka.

Dr. Ravindra Ruberu

Message from Director General of Health Services

I wish to congratulate the National Cancer Control Programme, for publishing ‘Cancer Incidence Data- 2006’. This publication has been prepared using the data collected from all the government cancer treatment centres.

One of the prime responsibilities of the National Cancer Control Programme is the periodic publication of the National Cancer Registry Data. I wish this data will be used for future planning activities and for research purposes.

I would like to extend my sincere appreciation to the World Health Organisation for the continuous assistance in providing funds for this important activity.

Dr. Ajith Mendis

Foreward

Publishing the Cancer Registry is one of the main responsibilities of the National Cancer Control Programme and this publication of 2006 data, follows the last publication which was the incidence data from 2001-2005.

The periodic publication of the ‘National Cancer Registry Data’ follows, collection of data of the new cancer patients registered annually, data verification and analysis. The first publication was done in 1985. After 1987, publications were done every five years and it is planned to publish national cancer data annually from this year due to the importance of timeliness of these information.

The annual incidence of cancers and its change in trends is important in evidence based planning of national cancer control activities and in decision making for providing treatment facilities.

This data will be of utmost importance to base research upon and we would like to invite and promote researchers to make the best use of this publication.

I take pride and pleasure in thanking the Deputy Director, Dr. Eshani Fernando, Dr. Nirmala Jayanthi and the staff of the NCCP for their team effort and the contribution which lead to this publication. Further the continued support extended to us by the World Health Organization is deeply appreciated.

Dr. Neelamani Paranagama
Director
National Cancer Control Programme

Executive Summary

The increasing trend in the incidence of cancers which was observed from 1985 had continued in 2006 as well. A total of 14,080 new cancer cases had been diagnosed in 2006. Out of them, 6205 were males and 7875, females. In 2006 the crude cancer incidence was 70.9 per 100,000 population and the age standardised rate (ASR) was 74.2. The crude incidence of cancers in males was 62.7 and in females it was 79.0. The increase in the incidence was more marked in females (from 73.4 in 2005 to 79.0 in 2006) (Cancer Registry, National Cancer Control Programme, 2009).

Breast cancer was the leading cancer in the population in 2006. The ASR has increased from 9.7 in 2005 to 10.8 in 2006, an increase of approximately 1 per 100,000 population. The second leading cancer was ‘lip, oral cavity and pharynx’. The ASR increased by approximately 1 per 100,000 population for this cancer from 2005 to 2006 as well. This increase is mostly due to the data collected from an additional source (from 4 oral and maxillo-facial surgery units) in 2006 in addition to the cancer treatment centres in 2005.

The five leading cancer sites among the males were, ‘lip, oral cavity and pharynx’, ‘trachea, bronchus and lungs’, oesophagus, ‘colon and rectum’ and lymphoma. Among the females, the top five cancer sites were breast, uterine cervix, ovary, thyroid and oesophagus.

With the increasing incidence of cancers, the deaths due to cancer have also increased. Even though the incidence rates of cancer in males was less than in females, the death rates due to cancer were more in males (Department of Census and Statistics, 2012).

The following treatment modalities were recorded for cancer cases diagnosed in 2006. Out of all patients, 46% had received surgical treatment, 52% chemotherapy and 50% radiotherapy whereas 1.4% of the patients had obtained only symptomatic treatment.

Introduction

The National Cancer Control Programme of Sri Lanka which was established 1980, started a Hospital Based Cancer Registry from 1985. The first publication of the Hospital Based Cancer Registry was done in 1990 presenting the cancer incidence data of 1985 collected from cancer treatment centres of the country. The second and the third cancer registries for the years 1986 and 1987 were published as a pilot project to evaluate the feasibility of doing the publication annually. As a result it was decided to publish the registry data every five years due to logistic constraints and the publications were made in 1990, 1995 and 2000. The last publication was done presenting data of 2001-2005 collected from six government cancer treatment centres distributed throughout the island. As most of the logistic issues have now been eased it was decided to publish the cancer incidence data annually considering the importance of timely dissemination of information. This publication presents cancer incidence data of 2006.

Methodology

2006 cancer incidence data was collected from six cancer treatment centres in the country, namely the National Cancer Institute, Maharagama, (NCI, M) and from five other cancer treatment centres situated in Teaching Hospitals Kandy, Karapitiya and Jaffna and General Hospitals Badulla and Anuradapura. (Cancer treatment centres in Batticoloa, Ratnapura and Kurunegala were not functional in 2006; hence no data collection done.) In addition, oral cancer data sent by the Oral and Maxillo-Facial Surgical Units of Gampaha, Kalutara, Galle and Matale were also included in the registry. Active data collection of the cancer cases registered at the cancer treatment centres in 2006 was done by trained pre-intern medical officers from the clinic record files maintained in cancer clinics under the supervision of cancer registry staff from 5 cancer treatment centres. Jaffna cancer treatment centre data which was collected by the centre was sent directly to the registry.

The registry consists of data of patients who had been diagnosed as having cancer microscopically or otherwise in 2006.

Initial training of data collectors was done by NCCP staff until inter and inter examiner variability in data retrieval was minimal. At the beginning, data retrieval was done under close supervision and later, a random sample was checked for accuracy to improve quality of data. Data quality checks were made during coding and at the basic analysis level. The clinic record numbers of the erroneous data sets were listed for retrieval and necessary corrections were made by examining the patient files for the second time.

This data was then fed to the computer using CanReg4® package by a data entry operator who had been trained by the registry staff. Duplicate search facility of CanReg4® was utilised to detect duplicate entries.

All multiple entries due to patients being registered in more than one treatment centre were identified and removed from the database using the duplicate searching mechanisms in the software by matching basic information of the patient, demographic variables, topography and morphology.

International Classification of Disease for Oncology (ICDO-3) was used for topographical and morphological coding. All patients with malignant tumours diagnosed as having cancer microscopically or by other methods were included in the registry.

Cases under behaviour code '1' (uncertain whether benign or malignant borderline malignancy) or '2' (carcinoma in situ) were included in the registry. Patients in whom cancer had been ruled out and suspected cases whose diagnosis had not been confirmed yet were omitted from the registry.

Appendix I- Statistical Terminology

Population at risk

It is the part of a population which is susceptible to develop a specific cancer. It is defined on the basis of demographic data, such as place of residence, sex, age group, etc. Years of risk duration are counted in person-years

Incidence

Incidence quantifies the number of new cases of disease that develop in a population of individuals at risk during a specified time interval. Usually it is given as per 100,000 population per year.

Mortality

It is usually expressed as a rate. It is a measure of the number of deaths (in general due to a specific cause) in a specific population, per unit time. Mortality rate is typically expressed in units of deaths per 1000 individuals per year.

Crude rate

Data on incidence or mortality are often presented as rates. For a specific tumour and population, a crude rate is calculated simply by dividing the number of new cancers or cancer deaths observed during a given time period by the corresponding number of person years in the population at risk. It is usually expressed as an annual rate per 100,000 persons at risk.

Crude incidence rate

= Total number of cases in the year/ Total midyear population at risk

Crude death rate

= Total number of deaths in the year/ Total midyear population at risk

Age-specific rate

The age-specific rate is calculated simply by dividing the number of new cancers or cancer deaths observed in a given age category during a given time period by the corresponding number of person years in the population at risk in the same age category and time period. The result is usually expressed as an annual rate per 100,000 person-years. In this publication, five-year age categories are used (highest group 75+).

Age -specific incidence rate

= Number of cases in the five-year age group/ population at risk in the corresponding age group

Age -specific death rate

= Number of deaths in the five-year age group/ population at risk in the corresponding age group

ASR (age-standardised rate)

Standardised rates are statistically constructed summary rates that account for the difference between populations. An age-standardised rate (ASR) is a summary measure of the rate that a population would have if it had a standard age structure. Standardisation is necessary when comparing several populations that differ with respect to age because age has such a powerful influence on the risk of cancer. The ASR is a weighted mean of the age-specific rates; the weights are taken from population distribution of the standard population. In this publication 'World Population' was taken as the standard population.
